

AMENDMENTS TO THE CLAIMS

1. (Currently Amended) A function randomness evaluating apparatus for a data encryption device comprising ~~at least one of:~~

~~higher order differential cryptanalysis resistance evaluating means for calculating the minimum value of the degree of a Boolean polynomial for input bits by which output bits of a function to be evaluated are expressed, and evaluating that the larger said minimum value, the higher the resistance of said function to higher order differential cryptanalysis is;~~

~~interpolation cryptanalysis resistance evaluating means for: when fixing a key y and letting x denote the input of a function to be evaluated, expressing an output y by $y = f_k(x)$ using a polynomial over Galois field which is composed of elements equal to a prime p or a power of said prime p ; calculating the number of terms of said polynomial; and evaluating the resistance of said function to interpolation cryptanalysis based on the result of said calculation;~~

~~partitioning cryptanalysis resistance evaluating means for: dividing all inputs of a function to be evaluated and the corresponding outputs into input subsets and output subsets; calculating an imbalance of the relationship between the subset of an input and the subset of the corresponding output with respect to their average corresponding relationship; and evaluating the resistance of said function to partitioning cryptanalysis based on the result of said calculation;~~
and

input means for inputting digital signals representing candidate functions $S(x)$ of S-box to be evaluated, input difference value Δx and output mask values Γy , and storing them in storage means;

differential-linear-cryptanalysis resistance evaluating means for: counting-calculating, for all sets of input difference value Δx and output mask value Γy of each of the a -functions $S(x)$ read out of the storage means to be evaluated, a the-number of inputs values x for which the inner product of $(S(x)+S(x+\Delta x))$ and said output mask value Γy is 1, and evaluating the resistance of said function to differential-linear cryptanalysis based on the result of said number calculation;
and

output means for outputting an output digital signal representing an evaluation result.

2. (Currently Amended) The function randomness evaluating apparatus of claim 1, wherein:

~~—said partitioning cryptanalysis resistance evaluating means is means for: dividing an input set F and an output set G of said function into u input subsets {F0, F1, ..., FFu-1} and v output subsets {G0, G1, ..., Gv-1}; for each partition pair (Fi, Gi) (i=0, ..., u-1; j=0, 1, ..., v-1), calculating the maximum one of probabilities that all outputs y corresponding to all inputs x of the input subset Fi belong to the respective output subsets Gj (j=0, ..., v-1); calculating a measure IS(F, G) of an average imbalance of a partition pair (F, G) based on all maximum values calculated for all partition pairs; and evaluating the resistance of said function to said partitioning cryptanalysis based on said measure; and~~

said differential-linear cryptanalysis resistance evaluating means is means for: calculating the following equation for every set of said input difference value Δx except 0 and said output mask value Γy except 0

$$\xi_S(\Delta x, \Gamma y) = \left| 2 \times \# \{x \in GF(2)^n \mid (S(x) + S(x + \Delta x)) \bullet \Gamma y = 1\} - 2^n \right|,$$

calculating a the maximum value Ξ among the calculation results; and evaluating the resistance of said function to said differential-linear cryptanalysis based on said maximum value Ξ .

3. (Currently Amended) The function randomness evaluating apparatus of claim 1 or 2, further comprising at least one of:

differential-cryptanalysis resistance evaluating means for calculating, for the ~~a~~-function $S(x)$ to be evaluated, the number of inputs values x that satisfy $S(x) + S(x + \Delta x) = \Delta y$ for every set $(\Delta x, \Delta y)$ and evaluating the resistance of said function to differential cryptanalysis based on the result of said calculation; and

linear-cryptanalysis resistance evaluating means for calculating, for the ~~a~~-function to be evaluated, the number of inputs values x for which the inner product of the input value x and its mask value Γx is equal to the inner product of a function output value $S(x)$ and its mask value Γy and evaluating the resistance of said function to linear cryptanalysis based on the result of said calculation.

4. (Canceled).

5. (Canceled).

6. (Currently Amended) A random function generating apparatus for a data encryption device comprising:

input means for inputting digital signals representing parameter values of each of a plurality of functions of different algebraic structures and storing them in storage means;

candidate function generating means for generating candidate functions each formed by a combination of said a plurality of functions of different algebraic structures based on said and having a plurality of parameters read out of the storage means;

resistance evaluating means for evaluating the resistance of each of said candidate functions to a cryptanalysis; and

selecting means for selecting those of said resistance-evaluated candidate functions which are have highly resistant to said cryptanalysis and outputting digital signals representing selected ones of said resistance-evaluated candidate functions;

wherein one of said plurality of functions of different algebraic structures is resistant to each of differential cryptanalysis and linear cryptanalysis.

7. (Canceled).

8. (Currently Amended) The random function generating apparatus of claim 6 ~~or 7~~, wherein said input means is adapted to input digital signals representing input difference values Δx and output mask values Γy and storing them in the storage means, and said resistance evaluating means comprises at least one of:

higher-order-differential cryptanalysis resistance evaluating means for: calculating a the minimum value of the degree of a Boolean polynomial for input bits by which output bits of each of said candidate functions are expressed; and evaluating the resistance of said each candidate function to higher order cryptanalysis based on the result of said calculation;

interpolation-cryptanalysis resistance evaluating means for: ~~when fixing a key y and letting x denote the input of said each candidate,~~ expressing an output value y as $y = f_k(x)$ for an input value x and a fixed key k using a polynomial over a Galois field which is composed of elements equal to a prime p or a power of said prime p; counting ~~calculating a~~ the number of terms of said polynomial; and evaluating the resistance of said each candidate function to interpolation cryptanalysis based on the result of said number calculation;

partitioning-cryptanalysis resistance evaluating means for: dividing all ~~inputs~~ input values of the a-function to be evaluated and the corresponding outputs values into input subsets and output subsets; calculating an imbalance of the relationships between the input subset of an input and the output subset of the corresponding output with respect to their average corresponding relationship; and evaluating the resistance of said function to partitioning cryptanalysis based on the result of said calculation; and

differential-linear cryptanalysis resistance evaluating means for: calculating, for every set of input difference value Δx and output mask value Γy of the a-function $S(x)$ to be evaluated, a ~~the~~ number of inputs values x for which the inner product of $(S(x) + S(x + \Delta x))$ and said output mask value Γy is 1; and evaluating the resistance of said function to differential-linear cryptanalysis based on the result of said calculation.

9. (Currently Amended) A method for evaluating the randomness of the input/output relationship of a function for data encryption, said method comprising ~~at least one~~ of:

inputting digital signals representing candidate functions $S(x)$ of S-box to be evaluated, input difference values Δx and output mask values Γy , and storing them in storage means;

~~— (a) a higher order differential cryptanalysis resistance evaluating step of: letting said function be represented by $S(x)$, calculating the minimum value of the degree of a Boolean polynomial for input bits of said function $S(x)$ by which its output bits are expressed; and evaluating the resistance of said function to higher order cryptanalysis based on the result of said calculation;~~

~~(b) a differential-linear cryptanalysis resistance evaluating step of: counting-calculating,~~ for every set of input difference value Δx and output mask value Γy of each of the a-functions

~~S(x) read out of the storage means to be evaluated, a the number of inputs values x for which an the inner product of (S(x)+S(x+Δx)) and said output mask value Γy is 1; and evaluating the resistance of said function to differential-linear cryptanalysis based on the result of said number calculation; and~~

~~outputting an output digital signal representing an evaluation result.~~

~~(c) a partitioning cryptanalysis resistance evaluating step of: dividing all inputs of a function to be evaluated and the corresponding outputs into input subsets and output subsets; calculating an imbalance of the relationship between the subset of an input and the subset of the corresponding output with respect to their average corresponding relationship; and evaluating the resistance of said function to partitioning cryptanalysis based on the result of said calculation; and~~

~~(d) an interpolation cryptanalysis resistance evaluating step of: when fixing a key y and letting x denote the input of said each candidate, expressing an output y by $y = f_k(x)$ using a polynomial over Galois field which is composed of elements equal to a prime p or a power of said prime p; calculating the number of terms of said polynomial; and evaluating the resistance of said function to interpolation cryptanalysis.~~

10. (Currently Amended) The randomness evaluating method of claim 9, wherein: said differential-linear cryptanalysis resistance evaluating step (b) is a step of: letting the input difference and output mask value of said function S(x) be representing by Δx and Γy, respectively, calculating the following equation for every set of said input difference value Δx except 0 and said output mask value Γy except 0

$$\xi_S(\Delta x, \Gamma y) = \left| 2 \times \# \{x \in \text{GF}(2)^n \mid (S(x) + S(x + \Delta x)) \bullet \Gamma y = 1\} - 2^n \right|;$$

calculating a the maximum value Ξ among the calculation results; and evaluating the resistance of said function to said differential-linear cryptanalysis using said maximum value Ξ; and

~~said partitioning cryptanalysis resistance evaluating step (c) is a step of: dividing an input set F and an output set G of said function into u input subsets {F0, F1, ..., Fu-1} and v output subsets {G0, G1, ..., Gv-1}; for each partition pair (Fi, Gi) (i=0, ..., u-1; j=0, 1, ..., v-1), calculating the maximum one of probabilities that all outputs y corresponding to all inputs x of~~

~~the input subset F_i belong to the respective output subsets G_j ($j = 0, \dots, v-1$); calculating a measure $IS(F, G)$ of an average imbalance of a partition pair (F, G) based on all maximum values calculated for all partition pairs; and evaluating the resistance of said function to said partitioning cryptanalysis based on said measure.~~

11. (Currently Amended) The randomness evaluating method of any one of claim 9, or 10, 35 or 36, further comprising at least one of:

(de) a differential-cryptanalysis resistance evaluating step of: ~~letting the output difference value of said function $S(x)$ be represented by Δx~~ , calculating the number of inputs values x that satisfy $S(x) + S(x + \Delta x) = \Delta y$ for every set $(\Delta x, \Delta y)$ except $\Delta x = 0$; and evaluating the resistance of said function to differential cryptanalysis based on the result of said calculation; and

(ef) a linear-cryptanalysis resistance evaluating means for calculating, for said function $S(x)$, the number of inputs values x for which the inner product of the input value x and its mask value Γx is equal to the inner product of a function output value $S(x)$ and its mask value Γy and evaluating the resistance of said function to linear cryptanalysis based on the result of said calculation.

12. (Canceled).

13. (Currently Amended) A random function generating method for data encryption comprising the steps of:

(o) inputting digital signals representing input difference values Δx , output mask values Γy and parameter values of each of a plurality of functions of different algebraic structures and storing them in storage means;

(a) setting various input values read out of the storage means as each parameter for each of candidate functions $S(x)$ of S-box and calculating output values corresponding to said various input values x ;

(b) storing the output values results of said calculation in storage means; and

(c) evaluating the resistance of each of said candidate functions to a cryptanalysis based on the output values stored in said storage means, and selectively outputting candidate function highly resistant to said cryptanalysis; and

wherein said step (c) ~~comprises~~comprising at least one of:

(c-1) a higher-order cryptanalysis resistance evaluating step of: calculating a the minimum value of the degree of a Boolean polynomial for input bits of each of said candidate functions by which its output bits are expressed; evaluating the resistance of said each candidate function to higher order cryptanalysis based on the result of said calculation; and leaving those of said candidate functions whose resistance is higher than a predetermined first reference and discarding the others;

(c-2) a differential-linear cryptanalysis resistance evaluating step of: calculating, for every set of input difference value Δx and output mask value Γy of each candidate function $S(x)$, a the number of inputs values x for which the inner product of $(S(x)+S(x+\Delta x))$ and said output mask value Γy is 1; evaluating ~~the~~ resistance of said function to differential-linear cryptanalysis based on the result of said calculation; and leaving those of said candidate functions whose resistance is higher than a predetermined second reference and discarding the others;

(c-3) a partitioning-cryptanalysis resistance evaluating step of: dividing all inputs values of each candidate function and the corresponding outputs values into input subsets and output subsets; calculating an imbalance of the relationship between the input subset ~~of an input~~ and the output subset ~~of the corresponding output~~ with respect to their average corresponding relationship; evaluating the resistance of said each candidate function to said partitioning cryptanalysis based on the result of said calculation; and leaving those of said candidate functions whose resistance is higher than a predetermined third reference and discarding the others; and

(c-4) an interpolation-cryptanalysis resistance evaluating step of: ~~when fixing a key y and letting x denote the input of said each candidate,~~ expressing an output value y as ~~by~~ $y = f_k(x)$ for an input value x and a fixed key k using a polynomial over a Galois field which is composed of elements equal to a prime p or a power of said prime p ; ~~counting~~ calculating a the number of terms of said polynomial; evaluating the resistance of said function to interpolation

cryptanalysis; and leaving those of said candidate functions whose resistance is higher than a predetermined fourth reference and discarding the others.

14. (Currently Amended) The random function generating method ~~apparatus~~ of claim 13, wherein:

said differential-linear-cryptanalysis resistance evaluating step (c-2) includes a step of: ~~letting the output mask value be represented by Γy~~ , calculating the following equation for every set of said input difference value Δx except 0 and said output mask value Γy except 0

$$\xi_S(\Delta x, \Gamma y) = \left| 2 \times \# \{x \in \text{GF}(2)^n \mid (S(x) + S(x + \Delta x)) \bullet \Gamma y = 1\} - 2^n \right|;$$

calculating a ~~the~~ maximum value Ξ among the calculation results; and evaluating the resistance of said candidate function to said differential-linear cryptanalysis based on said maximum value Ξ ; and

 said partitioning ~~cryptanalysis~~ resistance evaluating step (3) includes a step of dividing an input value set F and an output value set G of said function into u input subsets $\{F_0, F_1, \dots, F_{u-1}\}$ and v output subsets $\{G_0, G_1, \dots, G_{v-1}\}$; for each partition-pair (F_i, G_j) ($i = 0, \dots, u-1; j = 0, 1, \dots, v-1$), calculating a ~~the~~ maximum one of probabilities that all outputs values y corresponding to all inputs values x of the input subset F_i belong to the respective output subsets G_j ($j = 0, \dots, v-1$); calculating a measure $IS(F, G)$ of an average imbalance of a partition-pair (F, G) based on all maximum values calculated for all partition pairs; and evaluating the resistance of said candidate function to said partitioning cryptanalysis based on said measure.

15. (Original) The random function generating method of claim 13 or 14, wherein:

said step (c-1) includes a step of: when no candidate function remains undiscarded, easing the candidate function selecting condition by changing said first reference by a first predetermined width, and executing again the evaluation and selecting process;

said step (c-2) includes a step of: when no candidate function remains undiscarded, easing the candidate function selecting condition by changing said second reference by a second predetermined width, and executing again the evaluation and selecting process;

said step (c-3) includes a step of: when no candidate function remains undiscarded, easing the candidate function selecting condition by changing said third reference by a third predetermined width, and executing again the evaluation and selecting process; and

said step (c-4) includes a step of: when no candidate function remains undiscarded, easing the candidate function selecting condition by changing said fourth reference by a fourth predetermined width, and executing again the evaluation and selecting process.

16. (Currently Amended) The random function generating method of claim 13 or 14, further comprising ~~at least one of~~:

(c-5) a differential-cryptanalysis resistance evaluating step of: calculating, for each candidate function $S(x)$, the number of inputs x that satisfy $S(x) + S(x + \Delta x) = \Delta y$ for every set $(\Delta x, \Delta y)$ except $\Delta x = 0$; evaluating the resistance of said each candidate function to differential cryptanalysis based on the result of said calculation; and leaving those of said candidate functions whose resistance is higher than a predetermined fifth reference and discarding the others before said step (c-2); and

(c-6) a linear-cryptanalysis resistance evaluating step of: calculating, for each candidate function, the number of inputs values x for which the inner product of the input value x and its mask value Γx is equal to the inner product of a function output value $S(x)$ and its mask value Γy ; evaluating the resistance of said each candidate function to linear cryptanalysis based on the result of said calculation; and leaving those of said candidate functions whose resistance is higher than a predetermined sixth reference and discarding the others after said step (c-5).

17. (Canceled).

18. (Currently Amended) The random function generating method of claim 16 ~~or 17~~, wherein:

said step (c-5) includes a step of: when no candidate function remains undiscarded, easing the candidate function selecting condition by changing said fifth reference by a fifth predetermined width, and executing again the evaluation and selecting process; and

said step (c-6) includes a step of: when no candidate function remains undiscarded, easing the candidate function selecting condition by changing said sixth reference by a sixth predetermined width, and executing again the evaluation and selecting process.

19. (Previously Presented) The random function generating method of claim 14, wherein said candidate functions are each a composite function composed of at least one function resistant to said differential cryptanalysis and said linear cryptanalysis and at least one function of an algebraic structure different from that of said at least one function.

20. (Currently Amended) A recording medium having recorded thereon a random function generating method for data encryption as a computer program, said program comprising the steps of:

(a) setting various values as each parameter for candidate functions S(x) and calculating output values corresponding to various input values;

(b) storing the output values ~~results of said calculation~~ in storage means; and

(c) evaluating ~~the~~ resistance of each of said candidate functions to a cryptanalysis based on the output values stored in said storage means, and selectively outputting candidate function highly resistant to said cryptanalysis; and

wherein said step (c) ~~comprises~~ comprising at least one of:

(c-1) a higher-order cryptanalysis resistance evaluating step of: calculating a ~~the~~ minimum value of the degree of a Boolean polynomial for input bits of each of said candidate functions by which its output bits are expressed; evaluating the resistance of said each candidate function to higher order cryptanalysis based on the result of said calculation; and leaving those of said candidate functions whose resistance is higher than a predetermined first reference and discarding the others;

(c-2) a differential-linear cryptanalysis resistance evaluating step of: calculating, for every set of input difference value Δx and output mask value Γy of each candidate function $S(x)$, a ~~the~~ number of inputs values x for which the inner product of $(S(x)+S(x+\Delta x))$ and said output mask value Γy is 1; evaluating ~~the~~ resistance of said function to differential-linear cryptanalysis

based on the result of said calculation; and leaving those of said candidate functions whose resistance is higher than a predetermined second reference and discarding the others;

(c-3) a partitioning-cryptanalysis resistance evaluating step of: dividing all inputs values of each candidate function and the corresponding outputs values into input subsets and output subsets; calculating an imbalance of the relationship between the input subset of an input and the output subset of the corresponding output with respect to their average corresponding relationship; evaluating the resistance of said each candidate function to said partitioning cryptanalysis based on the result of said calculation; and leaving those of said candidate functions whose resistance is higher than a predetermined third reference and discarding the others; and

(c-4) an interpolation-cryptanalysis resistance evaluating step of: ~~when fixing a key y and letting x denote the input of said each candidate,~~ expressing an output value y as ~~by~~ $y = f_k(x)$ for an input value x and a fixed key k using a polynomial over a Galois field which is composed of elements equal to a prime p or a power of said prime p; counting a ~~calculating the~~ number of terms of said polynomial; evaluating the resistance of said function to interpolation cryptanalysis; and leaving those of said candidate functions whose resistance is higher than a predetermined fourth reference and discarding the others.

21. (Currently Amended) The recording medium of claim 20, wherein:

said differential-linear-cryptanalysis resistance evaluating step (c-2) includes a step of: ~~letting the output mask value be represented by Γy ,~~ calculating the following equation for every set of said input difference Δx except 0 and said output mask value Γy except 0

$$\xi_S(\Delta x, \Gamma y) = \left| 2 \times \# \{x \in GF(2)^n \mid (S(x) + S(x + \Delta x)) \bullet \Gamma y = 1\} - 2^n \right|;$$

calculating ~~a~~ the maximum value Ξ among the calculation results; and evaluating the resistance of said candidate function to said differential-linear cryptanalysis based on said maximum value Ξ ; and

said partitioning-cryptanalysis resistance evaluating step (3) includes a step of dividing an input value set F and an output value set G of said function into u input subsets $\{F_0, F_1, \dots, F_{u-1}\}$ and v output subsets $\{G_0, G_1, \dots, G_{v-1}\}$; for each partition-pair (F_i, G_j) ($i = 0, \dots, u-1; j$

= 0, 1, ..., v-1), calculating ~~a the~~ maximum one of probabilities that all outputs values y corresponding to all inputs values x of the input subset F_i belong to the respective output subsets G_j ($j = 0, \dots, v-1$); calculating a measure $IS(F, G)$ of an average imbalance of a partition-pair (F, G) based on all maximum values calculated for all partition pairs; and evaluating the resistance of said candidate function to said partitioning cryptanalysis based on said measure.

22. (Original) The recording medium of claim 20 or 21, wherein:

said step (c-1) includes a step of: when no candidate function remains undiscarded, easing the candidate function selecting condition by changing said first reference by a first predetermined width, and executing again the evaluation and selecting process;

said step (c-2) includes a step of: when no candidate function remains undiscarded, easing the candidate function selecting condition by changing said second reference by a second predetermined width, and executing again the evaluation and selecting process;

said step (c-3) includes a step of: when no candidate function remains undiscarded, easing the candidate function selecting condition by changing said third reference by a third predetermined width, and executing again the evaluation and selecting process; and

said step (c-4) includes a step of: when no candidate function remains undiscarded, easing the candidate function selecting condition by changing said fourth reference by a fourth predetermined width, and executing again the evaluation and selecting process.

23. (Currently Amended) The recording medium of claim 20 or 21, wherein said program ~~includes at~~ includes at least one of:

(c-5) a differential-cryptanalysis resistance evaluating step of: calculating, for each candidate function $S(x)$, the number of inputs x that satisfy $S(x) + S(x + \Delta x) = \Delta y$ for every set $(\Delta x, \Delta y)$ except $\Delta x = 0$; evaluating the resistance of said each candidate function to differential cryptanalysis based on the result of said calculation; and leaving those of said candidate functions whose resistance is higher than a predetermined fifth reference and discarding the others before said step (c-2); and

(c-6) a linear-cryptanalysis resistance evaluating step of: calculating, for each candidate function, the number of inputs values x for which the inner product of the input value x and its

mask value Γx is equal to the inner product of a function output value $S(x)$ and its mask value Γy ; evaluating the resistance of said each candidate function to linear cryptanalysis based on the result of said calculation; and leaving those of said candidate functions whose resistance is higher than a predetermined sixth reference and discarding the others after step (c-5).

24. (Canceled).

25. (Currently Amended) The recording medium of claim 23 ~~or 24~~, wherein:
said step (c-5) includes a step of: when no candidate function remains undiscarded, easing the candidate function selecting condition by changing said fifth reference by a fifth predetermined width, and executing again the evaluation and selecting process; and
said step (c-6) includes a step of: when no candidate function remains undiscarded, easing the candidate function selecting condition by changing said sixth reference by a sixth predetermined width, and executing again the evaluation and selecting process.

26. (Previously Presented) The recording medium of claim 21, wherein said candidate functions are each a composite function composed of at least one function resistant to said differential cryptanalysis and said linear cryptanalysis and at least one function of an algebraic structure different from that of said at least one function.

27. (Currently Amended) A recording medium having recorded thereon as a program a method for evaluating the randomness of the input/output relationship of a function for data encryption, said program comprising ~~at least one of~~:

~~— (a) a higher order differential cryptanalysis resistance evaluating step of: letting said function be represented by $S(x)$, calculating the minimum value of the degree of a Boolean polynomial for input bits of said function $S(x)$ by which its output bits are expressed; and evaluating the resistance of said function to higher order cryptanalysis based on the result of said calculation;~~

(~~a~~) a differential-linear cryptanalysis resistance evaluating step of: calculating, for every set of input difference value Δx and output mask value Γy of a function $S(x)$ to be evaluated, a

the number of inputs values x for which the inner product of $(S(x)+S(x+\Delta x))$ and said output mask value Γy is 1; and evaluating the resistance of said function to differential-linear cryptanalysis based on the result of said calculation;

~~—— (e) a partitioning cryptanalysis resistance evaluating step of: dividing all inputs of a function to be evaluated and the corresponding outputs into input subsets and output subsets; calculating an imbalance of the relationship between the subset of an input and the subset of the corresponding output with respect to their average corresponding relationship; and evaluating the resistance of said function to partitioning cryptanalysis based on the result of said calculation; and~~

~~—— (d) an interpolation cryptanalysis resistance evaluating step of: when fixing a key y and letting x denote the input of said each candidate, expressing an output y by $y = f_k(x)$ using a polynomial over Galois field which is composed of elements equal to a prime p or a power of said prime p ; calculating the number of terms of said polynomial; and evaluating the resistance of said function to interpolation cryptanalysis.~~

28. (Currently Amended) The recording medium of claim 27, wherein:

said differential-linear cryptanalysis resistance evaluating step ~~(a)~~ is a step of: letting the input difference and output mask value of said function $S(x)$ be representing by Δx and Γy , respectively, calculating the following equation for every set of said input difference value Δx except 0 and said output mask value Γy except 0

$$\xi_S(\Delta x, \Gamma y) = \left| 2 \times \# \{x \in GF(2)^n \mid (S(x) + S(x + \Delta x)) \bullet \Gamma y = 1\} - 2^n \right|;$$

calculating a the maximum value Ξ among the calculation results; and evaluating the resistance of said function to said differential-linear cryptanalysis using said maximum value Ξ ; and

~~—— said partitioning cryptanalysis resistance evaluating step (e) is a step of: dividing an input set F and an output set G of said function into u input subsets $\{F_0, F_1, \dots, F_{u-1}\}$ and v output subsets $\{G_0, G_1, \dots, G_{v-1}\}$; for each partition pair (F_i, G_j) ($i = 0, \dots, u-1; j = 0, 1, \dots, v-1$), calculating the maximum one of probabilities that all outputs y corresponding to all inputs x of the input subset F_i belong to the respective output subsets G_j ($j = 0, \dots, v-1$); calculating a measure $IS(F, G)$ of an average imbalance of a partition pair (F, G) based on all maximum~~

~~values calculated for all partition pairs; and evaluating the resistance of said function to said partitioning cryptanalysis based on said measure.~~

29. (Currently Amended) The recording medium of claim 27 or 28, said program further comprising at least one of:

(e) a differential-cryptanalysis resistance evaluating step of: ~~letting the output difference value of said function $S(x)$ be represented by Δx~~ , calculating a the number of inputs values x that satisfy $S(x) + S(x + \Delta x) = \Delta y$ for every set $(\Delta x, \Delta y)$ except $\Delta x = 0$; and evaluating the resistance of said function to differential cryptanalysis based on the result of said calculation; and

(f) a linear-cryptanalysis resistance evaluating means for calculating, for said function $S(x)$, the number of inputs values x for which the inner product of the input value x and its mask value Γx is equal to the inner product of a function output value $S(x)$ and its mask value Γy and evaluating the resistance of said function to linear cryptanalysis based on the result of said calculation.

30. (Canceled).

31. (Previously Presented) The random function generating method of claim 15, wherein said candidate functions are each a composite function composed of at least one function resistant to said differential cryptanalysis and said linear cryptanalysis and at least one function of an algebraic structure different from that of said at least one function.

32. (Previously Presented) The recording medium of claim 22, wherein said candidate functions are each a composite function composed of at least one function resistant to said differential cryptanalysis and said linear cryptanalysis and at least one function of an algebraic structure different from that of said at least one function.

33. (New) The function randomness evaluating apparatus of claim 1 or 2, further comprising at least one of:

higher-order-differential cryptanalysis resistance evaluating means for calculating a minimum value of the degree of a Boolean polynomial for input bits by which output bits of the function to be evaluated are expressed, and evaluating that larger said minimum value, higher the resistance of said function to higher order differential cryptanalysis is;

interpolation-cryptanalysis resistance evaluating means for: expressing an output value y as $y = fk(x)$ for an input value x and a fixed key k using a polynomial over a Galois field which is composed of elements equal to a prime p or a power of said prime p ; counting a number of terms of said polynomial; and evaluating the resistance of said function to interpolation cryptanalysis based on the result of said number; and

partitioning-cryptanalysis resistance evaluating means for: dividing all input values of the function to be evaluated and the corresponding output values into input subsets and output subsets; calculating an imbalance of the relationship between the input subset and the output subset with respect to their average corresponding relationship; and evaluating the resistance of said function to partitioning cryptanalysis based on the result of said calculation.

34. (New) The function randomness evaluating apparatus of claim 33, wherein:
said partitioning-cryptanalysis resistance evaluating means is means for: dividing an input value set F and an output value set G of said function into u input subsets $\{F_0, F_1, \dots, F_{u-1}\}$ and v output subsets $\{G_0, G_1, \dots, G_{v-1}\}$; for each partition-pair (F_i, G_j) ($i = 0, \dots, u-1; j = 0, 1, \dots, v-1$), calculating a maximum one of probabilities that all output value y corresponding to all input values x of the input subset F_i belong to the respective output subsets G_j ($j = 0, \dots, v-1$); calculating a measure $IS(F, G)$ of an average imbalance of a partition-pair (F, G) based on all maximum values calculated for all partition pairs; and evaluating the resistance of said function to said partitioning cryptanalysis based on said measure.

35. (New) The randomness evaluating method of claim 9 or 10, further comprising at least one of:

(a) a higher-order-differential cryptanalysis resistance evaluating step of: calculating a minimum value of the degree of a Boolean polynomial for input bits of said function $S(x)$ by

which its output bits are expressed; and evaluating the resistance of said function to higher order cryptanalysis based on the result of said calculation;

(b) a partitioning-cryptanalysis resistance evaluating step of: dividing all input values of the function to be evaluated and the corresponding output values into input subsets and output subsets; calculating an imbalance of the relationship between the input subset and the output subset with respect to their average corresponding relationships; and evaluating the resistance of said function to partitioning cryptanalysis based on the result of said calculation; and

(c) an interpolation-cryptanalysis resistance evaluating step of: expressing an output value y as $y = f_k(x)$ for an input value x and a fixed key k using a polynomial over a Galois field which is composed of elements equal to a prime p or a power of said prime p ; counting a number of terms of said polynomial; and evaluating the resistance of said function to interpolation cryptanalysis.

36. (New) The randomness evaluating method of claim 35, wherein:

said partitioning-cryptanalysis resistance evaluating step (b) is a step of: dividing an input value set F and an output value set G of said function into u input subsets $\{F_0, F_1, \dots, F_{u-1}\}$ and v output subsets $\{G_0, G_1, \dots, G_{v-1}\}$; for each partition-pair (F_i, G_j) ($i = 0, \dots, u-1; j = 0, 1, \dots, v-1$), calculating a maximum one of probabilities that all output values y corresponding to all input values x of the input subset F_i belong to the respective output subsets G_j ($j = 0, \dots, v-1$); calculating a measure $IS(F, G)$ of an average imbalance of a partition-pair (F, G) based on all maximum values calculated for all partition pairs; and evaluating the resistance of said function to said partitioning cryptanalysis based on said measure.

37. (New) The recording medium of claim 27 or 28, further comprising at least one of:

(b) a higher-order-differential cryptanalysis resistance evaluating step of: calculating a minimum value of the degree of a Boolean polynomial for input bits of said function $S(x)$ by which its output bits are expressed; and evaluating the resistance of said function to higher order cryptanalysis based on the result of said calculation;

(c) a partitioning-cryptanalysis resistance evaluating step of: dividing all input values of the function to be evaluated and the corresponding outputs into input subsets and output subsets; calculating an imbalance of the relationships between the input subset and the output subset with respect to their average corresponding relationship; and evaluating the resistance of said function to partitioning cryptanalysis based on the result of said calculation; and

(d) an interpolation-cryptanalysis resistance evaluating step of: expressing an output value y as $y = fk(x)$ for an input value x and a fixed key k using a polynomial over a Galois field which is composed of elements equal to a prime p or a power of said prime p ; counting a number of terms of said polynomial; and evaluating the resistance of said function to interpolation cryptanalysis.

38. (New) The recording medium of claim 37, wherein:

said partitioning-cryptanalysis resistance evaluating step (c) is a step of: dividing an input value set F and an output value set G of said function into u input subsets $\{F_0, F_1, \dots, F_{u-1}\}$ and v output subsets $\{G_0, G_1, \dots, G_{v-1}\}$; for each partition-pair (F_i, G_j) ($i = 0, \dots, u-1; j = 0, 1, \dots, v-1$), calculating a maximum one of probabilities that all output values y corresponding to all input values x of the input subset F_i belong to the respective output subsets G_j ($j = 0, \dots, v-1$), calculating a measure $IS(F, G)$ of an average imbalance of a partition-pair (F, G) based on all maximum values calculated for all partition pairs; and evaluating the resistance of said function to said partitioning cryptanalysis based on said measure.
